Groupware

GIS2

Outsourcing

Middleware

Groupware is a type of software that allows multiple users to work together on a single application. GIS2 stands for Geographic Information System.

Outsourcing is the practice of hiring workers from outside a company to perform tasks that are normally done by employees of the company. Middleware is software that acts as a bridge between an application and the underlying operating system.

RFID

XBRL, financial reporting
Supply chain management

Data warehousing

User centered web design

SOX, information filing
RFID (Radio Frequency Identification) is used to track and identify objects. It involves the use of tags that can be read by a device using radio waves. This technology is used in various industries to improve supply chain management, security, and inventory control. There are two main types of RFID tags: passive and active. Passive tags are powered by the reading device, while active tags have their own power source and can transmit information over a longer distance. The implementation of RFID technology can improve operational efficiency and accuracy in various applications.
