[visit site](#)

# Citrus Greening

- Aka Huanglongbing, yellow shoot or yellow dragon
- Bacterial disease
- It is a phloem limited systemic disease
- Latent period from 3 months to several years

# Citrus Greening

- Asian citrus psyllid
- Can be graft transmitted
- Seed transmission is not known yet
- All citrus cultivars and hybrids are susceptible
- Once the tree is infected, it remains infectious for rest of its life

# Asian Citrus Psyllid

- Vector of citrus greening disease
- May complete up to 30 generations per year under favorable conditions
- Adults lay eggs in the crevices of growing tips. Single female may lay 800 to 1000 eggs over her life span
- Nymphs feed on new flush and have 5 instars

# Asian Citrus Psyllid

- 4<sup>th</sup> or 5<sup>th</sup> instar acquire bacteria
- Nymphs produce waxy exudates
- Stays infectious for rest of life
- Both adults and nymphs can transmit disease
- Adults feed on lower side of the leaves at an angle of 45 degree

# Citrus Canker

Dr. Raj Singh

Assistant Professor, LSU AgCenter, Baton Rouge, LA

innovate . educate . improve lives

for the latest research-based information on just about anything, visit our Web site: [www.lsuagcenter.com](http://www.lsuagcenter.com)

# Citrus Canker

- All citrus varieties are susceptible
- Some are more susceptible than others
- Grapefruit, trifoliate oranges, Mexican/Key limes, navel oranges, sour oranges, sweet oranges, lemons, satsuma oranges, tangerines, Mandarin oranges, king oranges and kumquats

# Canker Epidemiology

- Bacteria survive in old cankers
- It enters through natural openings and wounds
- Infection requires free water on the tissue surface
- Lesions may appear in 10-14 days at 68-86°F but can stay active at wider range

# Canker Epidemiology

- Under optimal conditions bacteria ooze from the older cankers
- Short distance spread via wind borne rain, splashed water, overhead irrigation, lawn equipment, pruning tools, human clothes and hands etc
- Long distance dispersal via storms and human movement of infected or exposed citrus material

innovate . educate . improve lives

for the latest research-based information on just about anything, visit our Web site: [www.lsuagcenter.com](http://www.lsuagcenter.com)

# Canker Epidemiology

- Citrus canker is not vectored by insects or other organisms
- Injury caused on tissue by citrus leafminer, thorns, blowing sand, pruning or birds provide entry sites for bacteria
- Young expanding tissue is highly susceptible and as the tissue matures and hardens off, it becomes less susceptible to infection

innovate . educate . improve lives

for the latest research-based information on just about anything, visit our Web site: [www.lsuagcenter.com](http://www.lsuagcenter.com)

# Canker Survival

- Bacteria survive in old cankers on leaves, fruits and twigs
- It can also survive on weeds growing under the infected citrus trees
- Waiting period to plant another citrus is 2 years

# CTV

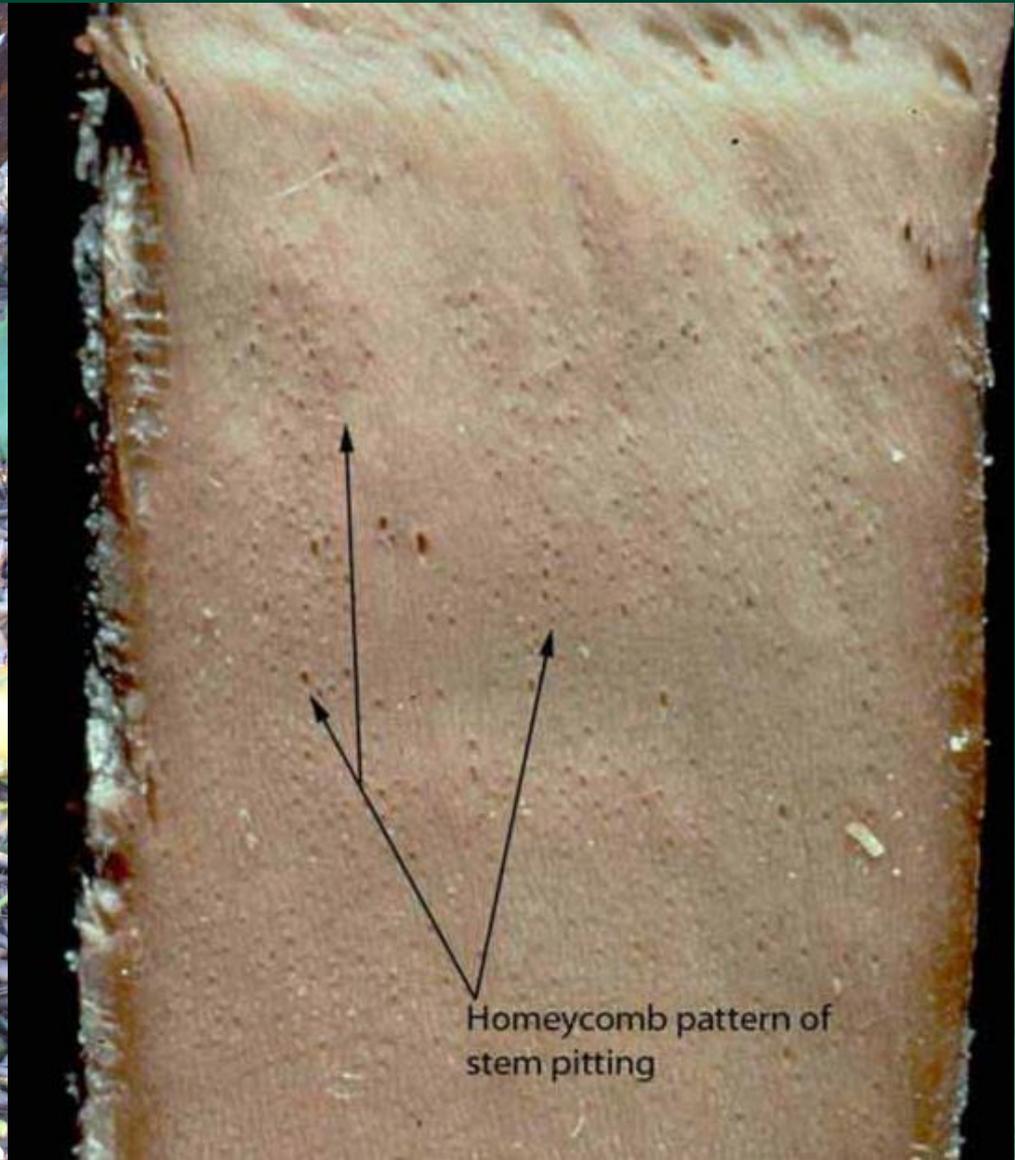

- Brown citrus aphid is the most efficient vector
- Also graft-transmitted, but not transmitted through seed
- Phloem limited virus
- Quick decline
- Stem pitting
- Seedling yellow

# Quick Decline

MaryLou Polek, Citrus Research Board

# Stem Pitting

# Foot/Root Rot/Gummosis

- Oomycetes- Not a true fungus
- *Phytophthora* spp.
- Soil-borne & likes compacted poor drained soils
- Can cause root rot, foot rot and gummosis
- Leaves wilt, turn yellow and drop
- Root rot complex with *Diaprepes* root weevil
